ABSTRAK

Pengembangan perangkat lunak sekarang ini sudah semakin kompleks. Umumnya masalah yang terjadi pada pengembangan perangkat lunak terdapat pada saat developer akan melakukan integrasi kode program perangkat lunak. Penggunaan Continuous Integration merupakan salah satu cara yang mampu digunakan untuk mengatasi masalah dari integrasi kode perangkat lunak dan testing yang terjadi, sehingga Continuous Integration dapat mengurangi waktu tempuh yang digunakan untuk menghasilkan suatu perangkat lunak [1]. Continuous Integration adalah proses mengotomatisasi pembuatan dan pengujian kode setiap kali anggota tim melakukan perubahan pada kontrol versi. Continuous Integration mendorong pengembang untuk membagikan kode dan unit test dengan menggabungkan perubahan ke dalam repositori kontrol versi bersama setelah melakukan perubahan pada kode program [2]. Banyak CI Tools yang dapat membantu pengguna untuk menerapkan Continuous Integration dalam proses pengembangan perangkat lunak, salah satu contohnya TeamCity. TeamCity pun memberikan kemudahan dalam konfigurasi alat CI Server, pembuatan build step, bahkan memberikan statistik yang dapat digunakan untuk menentukan kualitas dari perangkat lunak [3]. Untuk konfigurasi optimum pada TeamCity saat ini dapat dipilih berdasarkan bahasa pemrograman yang digunakan pada project, yang dimana pada penelitian ini digunakan bahasa pemrograman C# karena pada TeamCity sendiri tidak memiliki runner yang dikhususkan untuk platform desktop ataupun web. Sehingga build configuration yang digunakan pada penelitan ini sama untuk dua project yang digunakan.

Kata kunci: Continuous Integration, CI Tools, CI Server, Perangkat Lunak, Statistik, TeamCity.

ABSTRACT

Software development is now increasingly complex. Generally the problems that occur in software development are when developer going to integrate software program code. The use of Continuous Integration is one of the ways that can overcome the problem of integration of software code and testing that occurs, so that it can reduce the time used to produce a software [1]. Continuous Integration is the process of automating the creation and testing of code every time a team member changes the version control. Continuous Integration encourages developers to share code and unit tests by combining changes into the shared version control repository after each changes on code program [2]. Many CI Tools can help users to implement Continuous Integration in the software development process, one example is TeamCity. TeamCity also provides ease of configuration of CI Server, make the build steps, even provide statistical metrics that can be used to determine the quality of the software [3]. The optimum configuration for TeamCity can now be selected based on the programming language used in the project, which in this study used the C # programming language because TeamCity itself does not have runners specifically for desktop or web platforms. So that the build configuration used in this research is the same for the two projects used.

Keywords: Continuous Integration, CI Tools, Software Development, Statistic, TeamCity
